

Objects, Relations and Clusters for System Analysis

Joseph J Simpson
Mary J Simpson

Overview

- **Definitions**
- **Types of cluster analysis**
- **Role of system organizing relationship**
- **Abstract Relation Type (ART)**
- **Augmented Model-Exchange Isomorphism (AMEI)**
- **Connection to classical system engineering methods and techniques**

Systems and Clusters

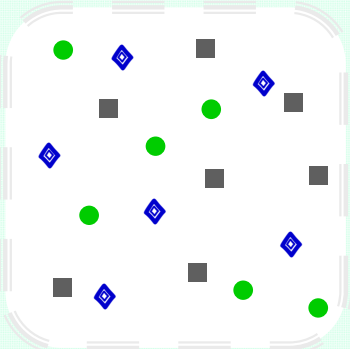

- **A 'construction-rule' system definition**
A relationship mapped over a set of objects
- **A 'function-rule' system definition**
A constraint on variation
- **Cluster**
A group of objects occurring closely together
- **Object-based cluster identification**
Based on object attributes
- **Space-based cluster identification**
Based on relation properties

Cluster Types

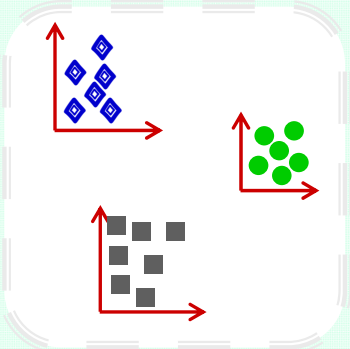

Object-Based Cluster

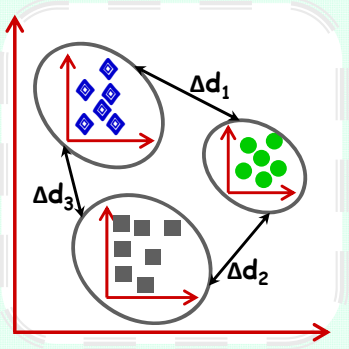

1 Identify, analyze objects

2 Determine cluster dimensions

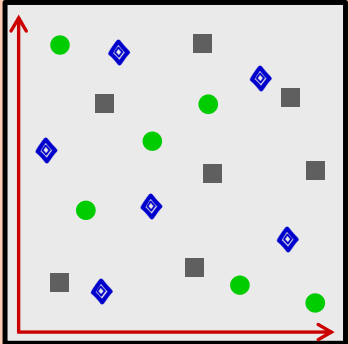

3 Analyze object clusters

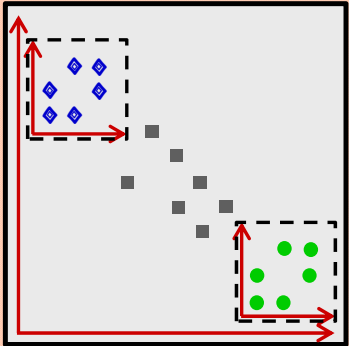

© 2013 System Concepts LLC

Space-Based Cluster

1 Identify analysis space using global system relation

2 Identify subspace(s) of interest

3 Enumerate objects in subspace

Variable and Object Analysis

- **Variable analysis based on object properties**

Degree of similarity among variables used to identify and describe the controlling object properties of interest

- **Object analysis based on class construction**

The activity of identifying the general types into which the objects may be categorized or classed

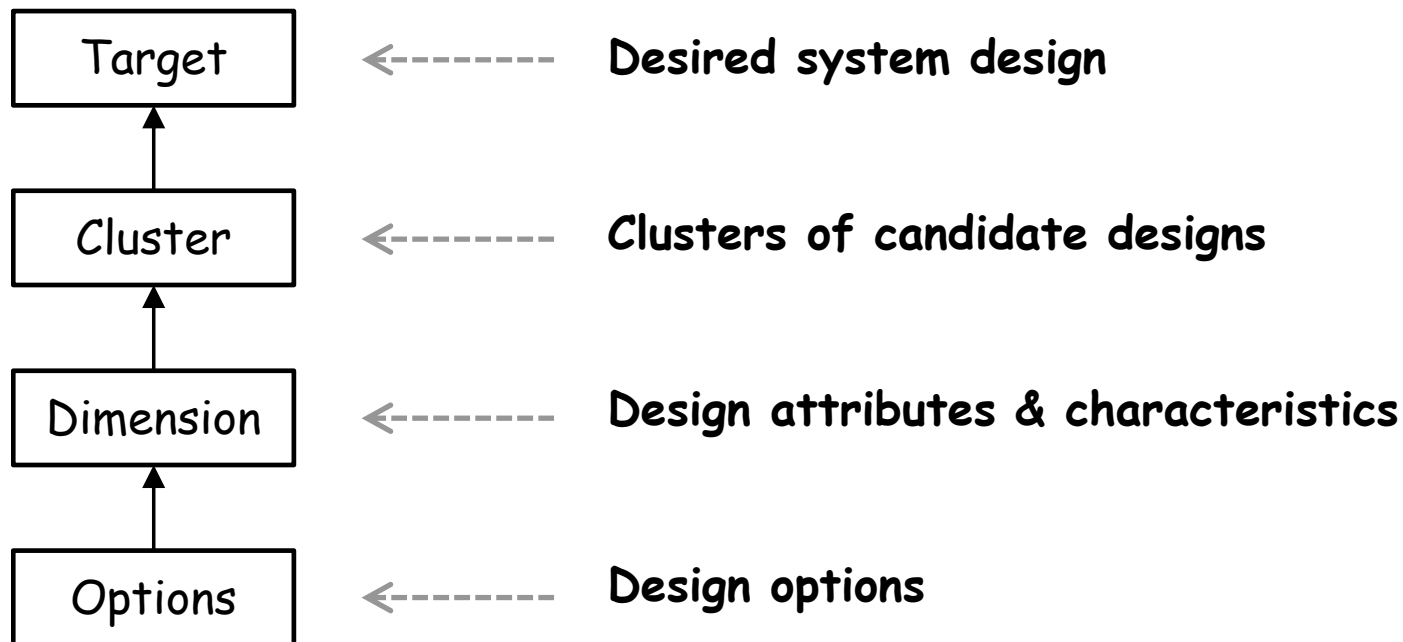

Object analysis requires a large amount of, and greater depth of, contextual information.

As a result, it requires more specific application subject matter expertise than variable analysis.

Context for Cluster Application

Warfield's 'Four Level Inclusion Hierarchy for Design'

This represents a generalized 'included-in' relation, that becomes more specialized as the Target is achieved.

The following logical relation properties apply to 'included-in'

- Irreflexive
- Asymmetric
- Transitive

Logical Relation Properties

Hi-Level Logical Characteristics of Three Dyadic Relations - v1.1

<p><i>Reflexivity</i> <i>Involves one individual</i></p>	<p><i>Symmetry</i> <i>Involves two individuals</i></p>	<p><i>Transitivity</i> <i>Involves three (or more) individuals</i></p>
<p>Reflexive</p> <p>A relation, R, is reflexive iff any individual that enters into the relation bears R to itself.</p> <p>*Identical with; Divisible by</p>	<p>Symmetric</p> <p>If any individual bears the relation to a second individual, then the second bears it to the first.</p> <p>*Touching</p>	<p>Transitive</p> <p>If any individual bears this relation to a second and the second bears it to a third, then the first bears it to the third. *Greater than; North of; Included in</p>
<p>Irreflexive</p> <p>A relation, R, is irreflexive iff no individual bears R to itself.</p> <p>*Stand next to; Father of</p>	<p>Asymmetric</p> <p>A relation, R, is asymmetrical iff, if any individual bears R to a second, then the second does not bear R to the first.</p> <p>*North of; Heavier than; Child of</p>	<p>Intransitive</p> <p>A relation, R, is intransitive iff, if any individual bears R to a second and the second bears R to a third, then the first does not bear R to the third. *Father of; 2" taller than</p>
<p>Nonreflexive</p> <p>A relation which is neither reflexive nor irreflexive is nonreflexive.</p> <p>*Respecting; Killing</p>	<p>Nonsymmetric</p> <p>A relation which is neither symmetrical nor asymmetrical is nonsymmetric.</p> <p>*Likes; Seeing</p>	<p>Nontransitive</p> <p>A relation which is neither transitive nor intransitive is nontransitive.</p> <p>*Admiring; Fearing</p>

***Examples**

The ART Construct

Abstract Relation Type (ART)

Prose Description (text, words)

- Formal pattern
- Informal prose

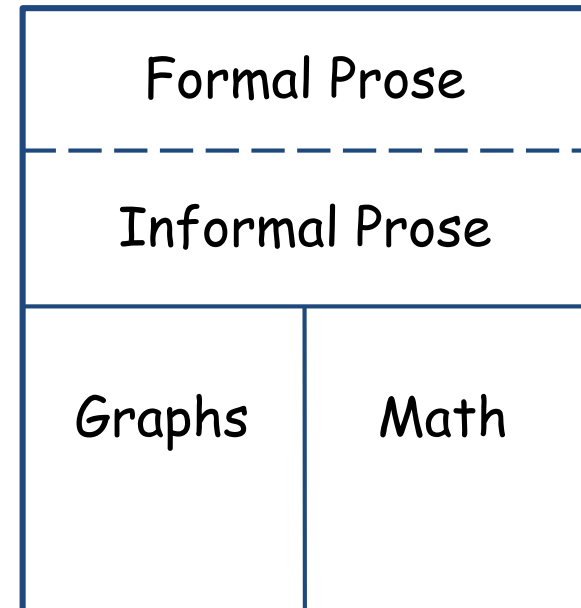

Graphic Representation

(directed graphs)

- Must have formal graphs
- Can also have informal graphs

Mathematics & Computer Representation

- Math equations
- Computer codes
- One or both

Augmented Model-Exchange Isomorphism

**Abstract
Relation
Type**

Reflected in

**Augmented
Model
Exchange
Isomorphism
(AMEI)**

Formal Prose	
Informal Prose	
Graphs	Math

ART 'Spaces'

Abstract Relation Type (ART) \equiv \mathcal{F} [MS, OS]

Outcome Space (OS) \equiv \mathcal{F} [VS₁, VS₂, ... VS_n, VS_{n+1}, ...]

Summary

- **Relationships create systems**
- **Abstract Relation Types focus on relationships**
- **Relationship logical properties create classes of system types**
- **Classical systems engineering methods and techniques support clustering**
